banknbox launches nexura, an integrated banking platform to help traditional banks go digital

The platform cuts the time needed to launch a digital bank from years to a few months

Cairo, November 2026: banknbox, a fintech company that builds digital banking infrastructure, has officially launched nexura, an integrated banking platform for setting up and running digital banks. With nexura, traditional banks and licensed financial institutions can become fully digital banks in months instead of years and keep pace with how fast the banking industry is changing.

The launch is part of banknbox's strategy to rethink digital banking infrastructure and make digital transformation simpler for financial institutions. nexura brings the systems and solutions a bank needs under one technology model. This reduces operational complexity, lowers development and integration costs, and gets new digital products and services to market faster.

In a statement, the company said the new platform reflects its aim to become a strategic technology partner for financial institutions. Instead of supplying individual banking solutions, banknbox now offers a complete ecosystem that supports innovation and makes banks more competitive in their markets.

Through its new platform, banknbox provides an end-to-end banking technology ecosystem encompassing Digital Core Banking, mobile and internet banking services, corporate banking solutions, card issuance and management systems, digital wallets, lending and loan management solutions, as well as risk management and fraud prevention systems. This comprehensive offering enables financial institutions to establish and operate fully integrated digital banks through a single technology provider.

nexura brings banking operations and services together in one connected environment, so banks no longer need separate systems joined by complex integrations. This makes operations more efficient and improves the customer experience. It also gives institutions

more room to develop their products and launch new services that meet market needs. Banks can skip building core systems from scratch and spend their resources on better services, customer experience, new revenue streams and growth in their target markets.

The company explained that launching a digital bank has traditionally meant working with several vendors. One supplies the core banking system, another builds the digital apps, a third handles cards and payments, and others cover lending, risk and security. Each step of development, integration, testing and rollout takes a long time. Because of this, some digital banks have taken years to launch. In Egypt, some projects took around four years to reach launch because of the number of systems and vendors and the technical and operational requirements involved.

banknbox offers a more flexible and efficient model that makes it possible to launch a full digital bank within months, built on a ready, connected ecosystem. The platform can also integrate with existing systems for institutions that want to keep part of their current technology. The company noted that the actual time to launch depends on each institution's needs, its technical and operational readiness, and the regulatory requirements of each market.

The launch comes as banking markets in Egypt, the Middle East and Africa change quickly, and as more financial institutions and fintech companies build business models around digital channels and modern technology.

banknbox said the Egyptian market has strong growth potential. Fintech companies are seeking digital banking licenses, and major banks are setting up separate digital entities, which creates new opportunities for providers of banking infrastructure and integrated technology. The company believes the future of digital banking will depend less on securing a license and more on how quickly and efficiently a bank can reach the market with a complete, secure digital experience. In that model, technology stops being an operational burden and becomes a driver of growth, innovation and expansion in financial services.

The company added that a digital banking license is an essential first step. Turning it into a bank that delivers safe, effective services, however, requires advanced technology that

meets operational and regulatory requirements and can support future growth. banknbox described the launch of nexura as a new stage in its growth strategy and an expression of its vision for banking: simpler technology, faster innovation, and flexible, scalable digital solutions.

banknbox serves clients across the Middle East, Africa and Asia, drawing on its experience in building financial and banking systems for a wide range of institutions. As part of its global expansion, the company recently registered its trademark with the European Union Intellectual Property Office (EUIPO). The registration gives its brand legal protection across EU member states and supports its plans to enter the European market as a provider of integrated digital banking solutions.
